2.2 Installation

The dome camera is for use in surface mounting applications and the mounting surface should be capable of supporting loads up to 3.3lb (1.5kg).

The dome camera's base should be attached to a structural object, such as hard wood, wall stud or ceiling rafter that supports the weight of the dome camera.

CAUTION: A silicone rubber sealant must be applied to seal the housing to secure waterproofing.

CAUTION: If you have a problem while installing the dome camera to the Mount Bracket, please try it again after loosening the screw "A" a little in a counter clockwise direction. We recommend to loosen approximately 0.25mm of screws from the dome bottom (unscrew about 0.5 times).

2.3 Basic Configuration of Dome Camera System

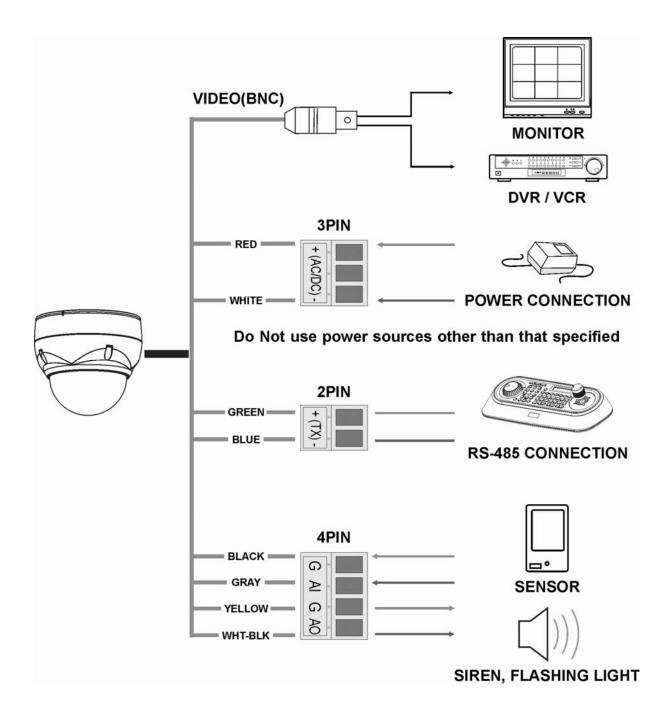

Figure 1 - Basic Installation Diagram

The dome camera must be installed by qualified service personnel in accordance with all local and federal electrical and building codes.

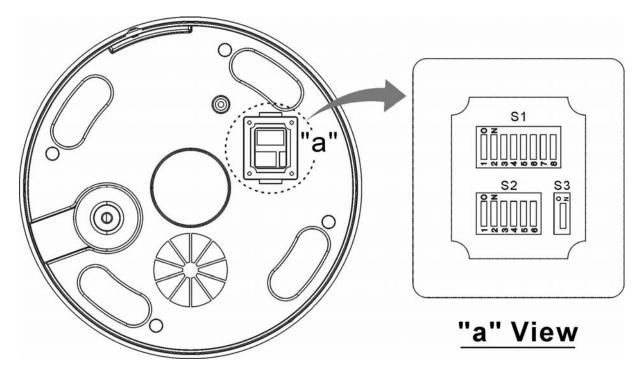

Figure 2 - Layout of DIP Switches

NOTE: Open the switch cover (position "a") and change the setting of DIP switches. The cover should be closed after setting DIP switches.

2.4 Setting Dome Camera Termination

The device which is connected at end of line, whether it is a dome camera or keyboard controller, must have the cable for communication terminated by setting the appropriate DIP switch. Without proper termination, there is potential for control signal errors. Total length of the cable for communication should not exceed 4000ft (1.2km).

2.5 Setting Dome Camera Address (ID)

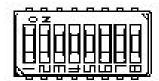

To prevent damage, each dome camera must have a unique address (ID).

When installing multiple dome cameras using a multiplexer, it is suggested that the dome camera address match the multiplexer port number.

The factory default setting is 1.

Refer to Figure 4.1 ~ 4.6 for setting the dome camera address (ID).

Example: Port 1 = Dome 1, Port 2 = Dome 2 ... Port 16 = Dome 16. If more than 16 dome cameras are installed using two or more multiplexers, ID of the dome camera should be ID of MUX x No. of camera IN. (e.g. multiplexer ID= n, Camera IN= m then ID of Dome =16x(n-1)+m)

90°, **100°**, **110°**, **120°**: allows the image to flip digitally when the camera moves over the setting angle vertically.

TILT LIMIT:

This option has been designed to limit the view angle as there is some obstruction in zooming out on specific area of the tilt angle.

ON: When this option is enabled, the range of the tilt angle will be limited to 10 degree. This can prevent from obstruction or bad focus problem caused by the horizontal line of the semi sphere in the bubble.

OFF: When this option is disabled, the range of the tilt angle will not be limited. When you zoom out within the range of the tilt angle, you will see the horizontal line of the semi sphere in the bubble.

Appendix C — Glossary

Alarm Action

The assigned responses for the dome camera when input change from normal to abnormal states. The dome may run a Preset, Pattern, or have no assigned action for 1 dome input. The dome may also send alarm state to the host controller for processing. See also Input Alarm and Normal Input State.

Area

Programmed start and end points of the dome's field of view around its pan axis. Each area is a part of a circular viewing area that extends around the dome. The areas can be different sizes. Up to 8 areas can be programmed for the dome.

Automatic Gain Control (AGC)

Allows for the amplification of the video signal in scenes with minimal ambient light. Many low-light scenes result in picture noise. As gain is increased, the picture noise is also amplified. When AGC is enabled, the value of the gain setting is based on feedback from the camera. When AGC is disabled, the camera uses the value set for the manual gain setting. The trade-off between picture level and noise may be adjusted when AGC is disabled.

On-screen Menu

The text overlay menu system used for setting dome features. The utility is accessed using a keystroke combination. The utility provides settings for camera functions, zoom, alarm, text display, and password protection.

Flip

Allows the dome to automatically turn 180 degrees when the camera tilts to its lower limit and stays in that position for a brief delay. When the dome flips (rotates), the camera starts moving upward as long as the tilt control is kept in the down position. Once the control is released, the tilt control returns to its normal operational mode. The flip feature is useful when you need to track someone who walks directly beneath the dome and continues on the other side.

Home Position

The default position to which the dome camera returns after an assigned period of inactivity passes. The default position may be a Preset, Tour, Pattern, or No Action.

Input Alarm

A connection point on the dome camera that enables the system to monitor Input Devices. There are 1 input available for the dome camera.

Input Device

External devices that provide information about the condition of system components that connect to the input on the dome camera. Typical input devices include door contacts, motion detectors and smoke detectors.

IR Mode

A feature of the camera that permits manual or automatic switching between color and IR (black-and-white) operation. When IR mode is active, clearer images may be obtained under low-light conditions.

Line Lock

Allows you to phase lock the video with the AC power line. When line lock is enabled, it prevents vertical video rolling when switching multiple cameras to a single monitor. If text appears slightly tinted on color monitors, disabling the line lock may prevent this problem.

Name Information

Relates to the display the dome name, the area where the dome is pointing, the name of the Preset or Pattern that is running, and alarm name. The display of each type of name setting can be enabled or disabled. When the display of camera or area title(name) is enabled, the information appears on the screen continuously. Preset, Tour and Pattern titles(names) appear only while they are active.

Normal Input State

Describes the expected state of a device connected to dome camera's input. The normal state may be open or closed. When a device is not in its normal input state, an alarm is issued.

North Position

User-definable setting that may correspond to magnetic north or some well-known landmark. Used to approximate the camera dome's pointing direction when Direction Indicators are enabled.

Slow Shutter

Setting used to improve the quality of video obtained in extreme low-light situations. When the Low Shutter setting is enabled, low-light information is collected over multiple fields based on the Shutter Limit setting. As a result, video may appear blurred or choppy in extreme low-light situations. This setting does not effect camera operation in normal lighting situations.

Pattern

A series of pan, tilt, zoom and focus movements from a single programmable dome. Up to 4 Patterns may be programmed for the dome camera.

Preset

Programmed video scene, based on a specific pan, tilt, zoom, and focus settings. Up to 120 Presets may be programmed for the dome camera.

Privacy Zone

Masked areas of the dome camera's viewing area. These masks prevent operators of the surveillance system from viewing these designated zones. The Privacy Zones move in relation to the dome camera's pan/tilt position. In addition, the apparent size of the Privacy Zone adjusts automatically as the lens zooms in or out. Up to 4 Privacy Zones may be established for a dome camera.

Vector Scan

Move from start point to end point including tilt and zoom simultaneously and linearly.

White balance

Adjustments in the color hue(red and blue) gains for a camera so that true white appears white in the image. It is normally compensated for by the automatic gain control. In some lighting conditions, you may need to manually adjust the red and blue settings for optimal viewing. When Automatic White Balance is enabled, the camera measures the image and automatically adjusts the red and blue settings to balance white. When Automatic White Balance is disabled, the camera uses the values set for the red and blue settings to balance white.
